DESIGN & ENGINEERING

Bringing Innovative Vending Solutions to *life*

Not all vending security issues can be effectively controlled by universal vending products.

To accommodate your precise needs, Safer Systems offers a dedicated Design & Engineering Service, ensuring you receive the products you need, when you need them.

Combined BT Phone & Vending Booth (above)

Safer Systems offers a custom-made design service, which specifically addresses the individual needs of each customer's product or security problem.

Innovation lies at the heart of all our designs: creating new products that often challenge convention; designs that effectively tackle crime or vandalism yet look good and are highly functional, vital in a competitive vending market.

And, because our team of specialists is experienced within the field of vending, they have practical, hands-on knowledge of a comprehensive range of vending and gaming machines. They understand the operational and financial procedures involved, designing their products to precisely meet those needs.

This experience ensures each customer receives tailored, practical and cost-effective solutions to their vending security needs from people who understand.

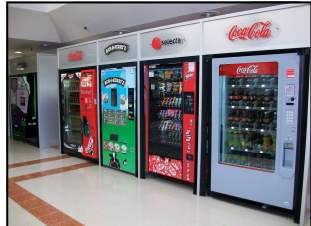

From design to build, Safer Systems will provide a professional service, converting your security needs into effective crime-inhibiting products. Working from a specific brief, Safer Systems will draft designs, supply working prototypes and deliver the final product.

Whether it's a simple modification to an existing product to ensure compatibility, or the creation of a new product, Safer Systems' team of design engineers is dedicated to providing effective security solutions within given budgets.
