

MIZMATIC LOCKING SOLUTIONS

MIZMATIC LOCKING SOLUTIONS

Combining operational flexibility with affordability.

Suitable for:

**Machine
manufacturers,
vending operators
and depots.**

SECURE & FLEXIBLE...

The anti-drill, pick-resistant locks provide the opportunity for each customer to receive dedicated unique lock and key codes for their operation.

Lock codes are quick and simple to change, using a change key, enabling codes to be set to a unique customer code, without the need to change the lock.

Security is further enhanced by the unique change lock, which allows for quick and easy lock code changes, without the need for costly lock replacement. The machine, however, remains secure, as the change key cannot open the machine.

Finally, lock picking of the Mizmatic is extremely difficult: lock picking attempts result in the lock being left in the neutral zero-code position, with the machine's security intact. Steel components for locks offering drill resistance are available if required.

SIMPLE...

The tubular lock and key designs make the Mizmatic easy to use. And because the Mizmatic locks are available in a wide range of sizes, one lock and key system can be used for a wide range of machines, vehicle safes etc, simplifying your key control management for operators through single key access for all machines.

AFFORDABLE...

The Mizmatic range of locks and keys offer an affective security barrier at a competitive price, making it the ideal security product for machine manufacturers, vending operators and depots alike.
